

Executive Insights in Construction Bottom Lines

What technology investment is vital for a company to make to increase productivity?

DAN HICKS
CHIEF OPERATING OFFICER

One of the fastest ways companies can boost productivity and reduce their exposure to risks is by focusing on technologies that connect the field to the office. Technology can provide real-time visibility into progress, quantities, materials and labor.

This helps everyone from executive management to foremen make informed decisions on the best use of resources and how to keep projects on track.

The use of mobile phones and tablets in the field also can dramatically increase productivity by eliminating data entry related to traditional paper-based forms, such as time cards and inspections.

Looking beyond field execution, project cost management, project administration, document management and project information modeling are also key areas to consider for technology spending.

Construction companies can further maximize their technology investments by implementing solutions that integrate easily with each other. This will allow them to gain a more complete view of their projects and where they stand.
